An online car management system for car dealers.

I need an online platform for car dealers where they can manage their inventory, make car ads, sell them for a fixed price on their own website using API or auction them.

I am already using a system which is good, but very old. I want my own.

Please login and check all features this system have and do not make any changes. User: demo@demo.com Password: Doesit1@1 hIps://billink.no/ User google translator.
This system is outdated and I want you to give it a user-friendly look and also do something that I don't get copyright issues.
This system have no option to run Auction Ads at all and I need auction ads as well.

I would also require an APP for this system where dealers can add new cars just by a click.

These ads will be exported to finn.no which is a local marketplace for ads using Rest API.

I can provide API details for car information from Norwegian car registrations department and finn.no

As an administrator I would also need an admin panel to manage dealers who want to be a part of this system.
